

2001 Water Test Results

The *Guidelines for Canadian Drinking Water Quality* apply to treated water only, that is, fresh water that people consume from a cold water tap. Therefore, the majority of the guidelines do not apply to the tests we take on the raw water at Shoal Lake and Deacon Reservoir because Winnipeg residents don't consume the water directly from either of these locations. The exception is the test results for herbicides, pesticides and PCBs at Deacon Reservoir, because the water distribution system downstream from Deacon is a closed system that should prevent the water from being contaminated by these chemicals. If you would like more technical information on the drinking water guidelines, visit this web site: http://www.hc-sc.gc.ca/ehp/ehd/bch/water_quality.htm

Test results are provided for Shoal Lake, Deacon Reservoir, and the distribution system.
